

Assembled Manual

Doc Writer

This preamble sits in the root document, before any include, so the assembled output begins with the root's own prose. The sections that follow are pulled in from separate files with three different include filters.

Introduction

This introduction file has a level-0 document title of its own. It is included with `leveloffset=+1`, so that title is shifted down one level and becomes a chapter of the assembled manual rather than a competing document title.

A second paragraph of introduction body text, so the chapter has real content under its heading.

Stable Features

The `stable-features` section is selected by tag, so only this tagged region is inlined while the untagged prose surrounding it in the source file is excluded from the assembled document.

Appendix Data

The appendix section heading and this paragraph are selected by an explicit four-to-eight line range, so the three lines above the heading are dropped from the assembled document.
